

Github Project: Git Commands Documentation Template

Programming for Data Science Nanodegree Program

You will use this template to copy and paste the git commands you used to complete all tasks on your local and remote git repository for this project. This file will serve as your submission for the GitHub project.

Instructions:

1. Make a copy of this Git Commands Documentation template on your Google Drive.
2. Complete the four sections in this document with the appropriate git commands.
3. Download this document as a PDF file.
4. Submit this on the Project Submission page within the Udacity Classroom.

1. Set Up Your Repository

The following are the steps you will take to create your git repository, add your python code, and post your files on GitHub.

Step 1. Create a GitHub profile (if you don't already have one).

Step 2. Fork a repository from Udacity's [GitHub Project repository](https://github.com/cabean85/https-github.com-cabean85-pdsnd_github-CKeeley) and provide a link to your forked GitHub repository here:

GitHub Repository Link
https://github.com/cabean85/https-github.com-cabean85-pdsnd_github-CKeeley

Step 3. Complete the tasks outlined in the table below and copy and paste your git commands into the "Git Commands" column. The first git command is partially filled out for you.

	Tasks	Git Commands
A.	Clone the GitHub repository to your local repository.	https://github.com/cabean85/https-github.com-cabean85-pdsnd_github-CKeeley
B.	Move your bikeshare.py and data files into your local repository.	No git command needed (you can use cp or a GUI) - Branch created with folder for bikeshare project
C.	Create a .gitignore file containing the name of your data file.	No git command needed (you can use touch or a GUI) - Created to hold .csv files for bike share project
D.	List the file names associated with the data files you added to your .gitignore	No git command needed (add the file names into your .gitignore file) - Added bike share .csv files into the .gitignore folder as they were to big

E.	Check the status of your files to make sure your files are not being tracked	Git status
F.	Stage your changes.	Git add
G.	Commit your changes with a descriptive message.	DONE - comment on ReadMe commit
H.	Push your commit to your remote repository.	Commit

2. Improve Documentation

Now you will be working in your local repository, on the BikeShare python file and the README.md file. You should repeat steps **C** through **E** three times to make at least three commits as you work on your documentation improvements.

	Tasks	Git Commands
A.	Create a branch named <i>documentation</i> on your local repository.	Branch created for each project of the Udacity program
B.	Switch to the <i>documentation</i> branch.	DONE
C.	Update your README.md file.	No git command needed (edit the text in your README.md file) - DONE
D.	Stage your changes.	Branches changes saved
E.	Commit your work with a descriptive message.	Each branch was created and committed separately.
F.	Push your commit to your remote repository branch.	??
G.	Switch back to the master branch.	Always swapped to master after branch was committed

3. Additional Changes to Documentation

In a real world situation, you or other members of your team would likely be making other changes to documentation on the documentation branch. To simulate this follow the tasks below.

	Tasks	Git Commands
A.	Switch to the <i>documentation</i> branch.	One branch was created for each project
B.	Make at least 2 additional changes to the documentation - this might be additional changes to the README or changes to the document strings and line comments of the bikeshare file.	Files for projects were add to the folder once the branch was created
C.	After each change, stage and commit your changes. When you commit your work, you should use a descriptive message of the changes made. Your changes should be small and aligned with your commit message.	Folder and files to each branch project was committed
D.	Push your changes to the remote repository branch.	commit
E.	Switch back to the <i>master</i> branch.	DONE
F.	Check the local repository log to see how <i>all the branches</i> have changed.	
G.	Go to Github. Notice that you now have two branches available for your project, and when you change branches the README changes.	No git command needed - More than 2 branches as there were 3 projects for the program

4. Refactor Code

Now you will be working in your local repository, on the code in your BikeShare python file to make improvements to its efficiency and readability. You should repeat steps **C** through **E** three times to make at least three commits as you refactor.

	Tasks	Git Commands
A.	Create a branch named <i>refactoring</i> on your local repository.	Refactoring branch created and not merged with master
B.	Switch to the <i>refactoring</i> branch.	Done
C.	Similar to the process you used in making the documentation changes, make 2 or more changes in refactoring your code.	No git command needed (edit the code in your python file)
D.	<i>For each change</i> , stage and commit your work with a descriptive message of the changes made.	https://github.com/cabean85/Programming_for_Data_Science_with_Python_Nanodegree/pull/6
E.	Push your commits to your remote repository branch.	Refactoring branch merged with master
F.	Switch back to the <i>master</i> branch.	
G.	Check the local repository log to see how <i>all the branches</i> have changed.	https://github.com/cabean85/Programming_for_Data_Science_with_Python_Nanodegree/branches
H.	Go to GitHub. Notice that you now have 3 branches. Notice how the files change as you move through the branches.	No git command needed

5. Merge Branches

	Tasks	Git Commands
A.	Switch to the <i>master</i> branch.	
B.	Pull the changes you and your coworkers might have made in the passing days (in this case, you won't have any updates, but pulling changes is often the first thing you do each day).	
C.	Since your changes are all ready to go, merge all the branches into the master. Address any merge conflicts. If you split up your work among your branches correctly, you should have no merge conflicts.	I merged each branch as it was completed. I do think merging many at once is ideal.
D.	You should see a message that shows the changes to the files, insertions, and deletions.	No git command needed
E.	Push the repository to your remote repository.	
F.	Go to GitHub. Notice that your master branch has all of the changes.	No git command needed

Submission:

This concludes the project.

- Please review this document to make sure you entered all the required response fields in all four sections.
- Download this document as a PDF file.
- Submit the PDF file on the Project Submission page within the Udacity Classroom.
